The general idea of my project is to base the task manager on the google's keep notes app.

The plan currently is to have 2 models, one for the "notes" and one for the "categories". The models will be many to many if I could do it, otherwise I would have the "task" to be unique and each "category" would be related to multiple "notes".

The layout of the app is to have a search bar and categories of the "notes" at the top of the app. The search bar will search through the titles or content of the notes, filtering only notes that have exact matches to the string typed in the search bar. The categories will filter through notes that have been tagged with the particular category. The default would be all. Notes can have no categories associated with it. A blank note will be located at the top left hand corner, which when clicked, will allow the user to create a new note. If the time allows, a function will be created to allow the user to change the colour of the note.

Am currently facing challenges with finding time to work on this project. Went overseas immediately after my exams and had some errands to do immediately after flying home. Was rather busy till Christmas. Will be having multiple driving lessons a day until school reopens.

Thanks for taking the time to read this write-up.

May you have a happy new year!!
